

Xanthomonas populi

(Bacterial poplar canker)

What does it attack?

It attacks adult poplars.

How to identify it?

Large bulges are observed on the trunk (Fig. 1).

Figura 1

What damage does it cause?

In infected trees in the advanced phase of the disease this lump prevents circulation. (Fig. 2).

It weakens the tree and prevents its growth, even causing its death.

When to see it?

Once the disease has begun to develop.
