

Dothichiza populea

(Dothichiza poplar canker)

What does it attack?

It attacks young poplars.

How to identify it?

On the trunk, the bark is necrotic (blackish-dark color) (**Fig. 1**).

What damage does it cause?

Causes dryness in young plants. First it causes the death of the branches (presence of brown spots on the bark).

Next, it usually leads to the total death of the tree (**Fig. 2**).

When to see it?

Once the disease has begun to develop.
